

11 Advanced**Term 3 Test 1****Reading****Read the following passage and answer the following**

From the moment a child is born, communication begins. Although infants cannot speak, they quickly start interacting with the world around them. Crying, for example, is not just a sign of discomfort; it is an early form of communication that signals different needs such as hunger, fatigue, or the desire for attention.

As babies grow, they begin to experiment with sounds. This stage, often referred to as "babbling," plays a crucial role in language development. During this period, children produce repetitive sounds like "ba-ba" or "da-da," not necessarily with meaning, but as a way of practicing the coordination between their mouth, tongue, and breathing. Researchers believe that this stage helps lay the foundation for later speech.

Interaction with caregivers is essential at this stage. When adults respond to a baby's sounds, even if they are unclear, the child learns that communication is a two-way process. This exchange encourages the child to continue experimenting with sounds and eventually attach meaning to them.

In contrast, limited interaction may slow down language development.

As children approach their first year, they begin to understand simple words and may start producing their first meaningful expressions. However, language development does not happen in isolation.

Social environment, emotional support, and exposure to language all influence how effectively a child learns to communicate.

It is important to note that every child develops at a different pace. While some may begin speaking earlier, others take more time. These differences are natural and should not always be a cause for concern. What matters most is consistent interaction, encouragement, and a supportive environment that allows the child to develop confidently.

Section A

1. What is crying an example of?
 - A. A physical exercise
 - ☒ B. An early form of communication
 - C. A language skill
 - D. A learned behavior

2. What happens during the babbling stage?
 - A. Children speak full sentences
 - ☒ B. Children remain silent
 - C. Children produce repeated sounds
 - D. Children read words

3. Why is interaction with caregivers important?
 - A. It teaches grammar rules
 - B. It stops children from crying
 - ☒ C. It helps children understand communication
 - D. It improves memory

4. What affects language development?

A. Only school

B. Only age

☒ C. Social and emotional factors

D. Only intelligence

Section B

5. The word “coordination” in paragraph 2 most nearly means:

A. balance and control of movement

B. speed of speaking

☒ C. memory ability

D. emotional reaction

6. What can be inferred about children with limited interaction?

A. They learn faster

☒ B. Their language may develop more slowly

C. They become more social

D. They speak earlier

7. What does the phrase “two-way process” suggest?

A. Communication happens once

B. Only adults speak

☒ C. Both child and adult participate

D. It is not important

8. Why do researchers consider babbling important?

A. It shows intelligence

☒ B. It prepares children for real speech

C. It replaces real language

D. It reduces crying

Section C

9. What is the main idea of the passage?

A. Babies cry frequently

☒ B. Language develops through interaction and stages

C. Children learn only from school

D. Speaking is easy for all children

10. Why does the writer mention differences between children?

A. To compare intelligence

☒ B. To show that development varies naturally

C. To criticize slow learners

D. To explain school systems

11. Which statement would the writer most likely agree with?

A. Children should learn alone

B. Early communication is unimportant

☒ C. Support and interaction are essential

D. All children develop at the same speed

12. What is the tone of the passage?

A. Critical

☒ B. Informative

C. Emotional

D. Humorous

Writing

Write a paragraph of 70-90 words about how you compare your journey with acquiring your mother tongue compared to how you have learned English.

My mother tongue was learned organically — I heard my family speak it at home every day, and learned it by listening to them and repeating instead of studying rules. On the other hand, English was a formal process and it took time, effort, memorizing vocabulary words and so on. At school I did have to read through the rules and exercise. But the two journeys are similar because it require practice and engagement. I think I become a much better English speaker over the years; just as with my first language I learned it by speaking, listening and reading literaly every day.
