

Activity 2.3.1: Define design requirements

Project title: The Ai Pilots

Requirement	Notes
Required functions and features: 1. Search and display available flights based on user input (destination, dates, passengers). 1. Compare flight prices from different airlines clearly. 2. Explain baggage policies, travel conditions, and extra fees in simple language. 3. Provide personalized suggestions for families, including children, elderly, and people with special needs. 4. Answer user questions using an AI chatbot interface.	
Size, weight, or space limits: 1. The system will be a digital prototype (web or app-based), so no physical size or weight constraints apply. 2. Must be lightweight enough to run on a standard school computer or browser.	
Cost or budget limits: 1. Should use free or low-cost tools (e.g., free AI platforms, basic coding tools). 2. No real financial transactions or paid APIs required.	
Required materials or tools: 1. Computer or laptop with internet access. 2. AI platform (e.g., LLM chatbot tool). 3. Research tools (websites for airline comparison).	
Environmental considerations: 1. Digital solution reduces paper usage. 2. Should avoid unnecessary data processing to reduce energy usage. 3. Promote eco-friendly travel options where possible (e.g., fewer stopovers).	

Safety requirements: 1. Must not use real personal or payment data. 2. Clearly state that it is a prototype using simulated data. 3. Ensure user privacy and avoid collecting sensitive information. 4. Follow UAE MOE ethical AI guidelines.	
Any other constraints or conditions: 1. Must include a statement about simulated data and educational use. 2. Should address AI limitations and possible bias. 3. Must be easy to use for beginners. 4. Should be tested with peer feedback.	

Write clear statements describing what the solution must do.

1. The system must allow users to search for flights using simple inputs.
2. The system must present flight options in a clear and easy-to-understand format.
3. The system must explain airline policies (baggage, fees, conditions) in simple language.
4. The system must provide helpful recommendations based on user needs.
5. The system must respond to user questions using AI-generated answers.
