

Stage 4: Possible Solutions Activities 2.4.1-2.4.3

2.4.1: Use what you learned from the problem definition, research, and requirements to generate **at least two different solution ideas**.

You may use **sketches, diagrams, or short notes** to explain your ideas.

Make sure each solution is realistic and considers the key requirements from Stage 3.

2.4.2: Explain how each solution would work in practice and keep descriptions simple and realistic.

2.4.3: Create a visual representation for **each solution** to show how it would work.

You may use:

- Sketches
- Diagrams
- Flowcharts

Your visuals should show:

- How users interact with the solution
- The main system components
- Where AI is used (for example: data input, decision-making, output)

**Remember to
label your
drawings clearly.**

Solution 1: AI Chatbot Flight Assistant

Description:

A chatbot-based airline assistant where users type their travel details and ask questions about flights. The chatbot searches simulated flight data and gives users flight options, prices, baggage information, and travel rules in simple language.

how it solves the problem?

It reduces confusion by explaining complex airline information clearly and helping users compare flights easily.

Identify **one key feature or approach** that makes it different from the other solution(s):

Real-time chatbot conversation where users can ask follow-up questions.

What type of data needed?

Simulated flight schedules, Ticket prices, Baggage policies, Travel rules.

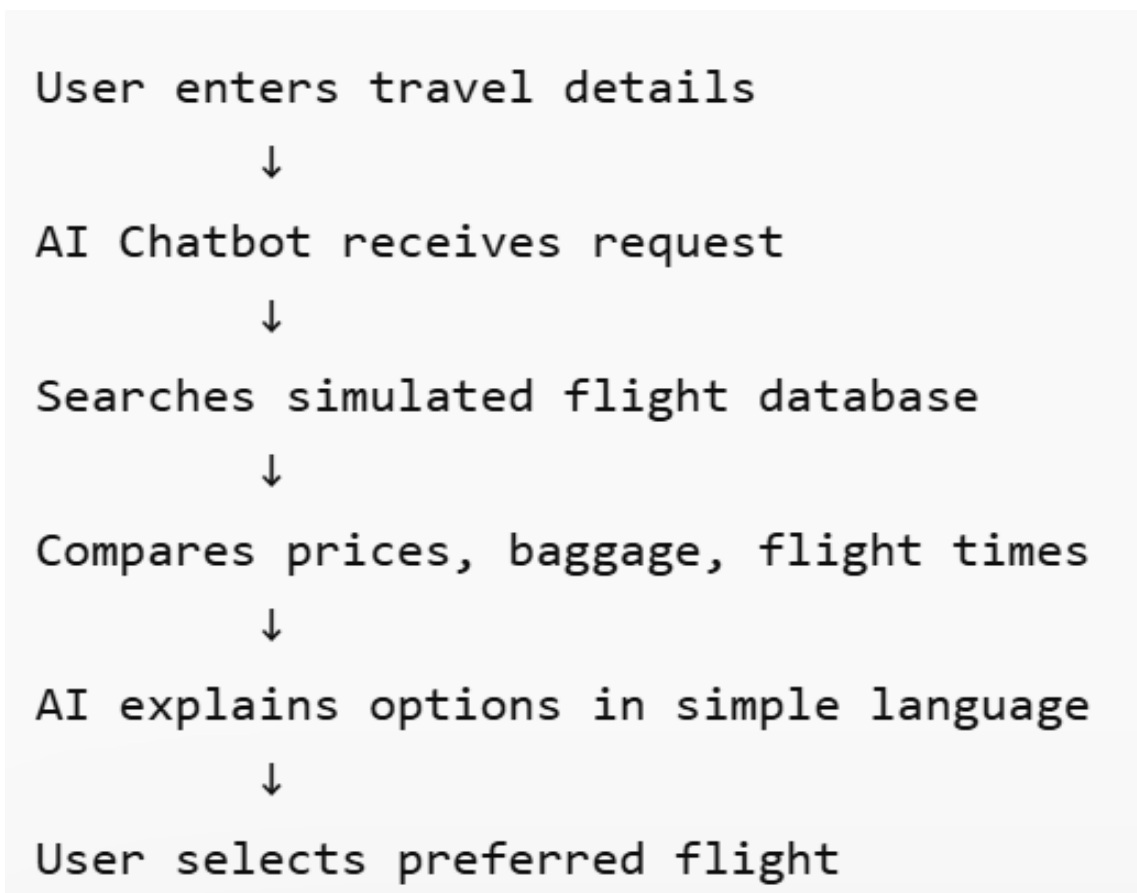

How AI would be used?

AI chatbot responses, Personalized flight recommendations.

Any safety or ethical considerations?

Uses simulated data only, Protect user privacy.

Sketch / diagram / flowchart of the solution:

Solution 2: Smart Flight Comparison Dashboard

Description:

A website dashboard where users enter travel details and receive a list of flight options shown in charts/tables. The system highlights the cheapest, fastest, and best-value flights.

how it solves the problem?

It helps users quickly compare multiple flight options without feeling overwhelmed by too much information.

Identify **one key feature or approach** that makes it different from the other solution(s):

Visual comparison dashboard with graphs and filters instead of chatbot conversations.

What type of data needed?

Simulated airline prices, Flight duration data, Baggage fees, Airline ratings.

How AI would be used?

AI recommendation system, Price prediction.

Any safety or ethical considerations

Uses simulated data only, Ensure fairness in recommendations.

Sketch / diagram / flowchart of the solution:
