

Stage 4: Possible Solutions Activities 2.4.4 – 2.4.5

Activity 2.4.4: Compare and evaluate solutions

Your team has developed two AI solution ideas.
Evaluate both solutions using measurable and analytical methods before selecting one.

Step 1: Define Evaluation Criteria
Use performance and impact indicators such as:

- Accuracy
- Response time
- Reliability
- User impact
- Ethical / safety risk

Step 2: Analyse Each Solution
For Solution 1 and Solution 2:

- Estimate or test performance for each criterion.
- Use structured scoring (e.g. % accuracy, seconds, 1–5 scale).
- Record evidence from analysis or simulation.

Evaluation Table

Evaluation Criteria	Solution 1 (AI Chatbot Flight Assistant)	Solution 2 (Smart Flight Comparison Dashboard)	Evidence / Analysis Method
Accuracy (%)	90% – gives accurate answers using flight database	85% – compares flights well but may miss detailed questions	Test dataset / scenario simulation
Response time (sec)	3 seconds	2 seconds	Timed trial
Reliability	High – works well for answering questions repeatedly	Medium – depends on dashboard filters working properly	Multiple run tests
User impact	High – easier for first-time travelers and families	Medium – useful but may confuse some users with too much data	Scenario-based evaluation
Ethical risk	Low – clearly explains it uses simulated data	Medium – users may misunderstand price predictions	Risk scenario testing

Activity 2.4.5: Requirements check

Use your measurable requirements from **Stage 3** to check whether each solution meets the requirements.

Requirement (Activity 2.3.1/ 2.3.3)	Solution 1 (yes/no)	Solution 2 (yes/no)
Easy-to-understand language	Yes	No
Clear flight price comparison	Yes	Yes
Shows baggage allowances clearly	Yes	Yes
Fast response time	Yes	Yes
Supports families, elderly, and special needs users	Yes	No
Uses simulated data only	Yes	Yes
Protects user trust with ethical AI guidelines	Yes	Yes
