

Activity 2.5.2: Finalise the solution design

Clearly describe your final solution in its complete form.

You will:

- Summarise how the solution works from start to finish
- Identify the main system components
- Explain where and how AI is used in the solution
- Combined features from multiple solutions (for example: Feature A from solution 1 + Feature B from solution 2 and so on)

Keep descriptions clear and realistic.

Answer:

The final solution is an **AI-powered airline booking assistant prototype** that helps users search for flights and understand booking information more easily. Users enter their travel details such as destination, travel dates, number of passengers, and preferences. The system searches simulated flight data and shows available flights with prices, baggage allowances, flight duration, and extra fees. The AI assistant explains this information in simple language and recommends the best option based on the user's needs. Users can then review the total cost before choosing a flight. No real booking or payment is made.

The main system components are a **user interface**, a **simulated flight database**, an **AI chatbot**, and a **recommendation system**.

AI is used through **natural language processing** to answer user questions, compare flights, and simplify complex airline policies. It also gives personalized recommendations based on user preferences.

The solution combines features from multiple existing systems: price comparison from Skyscanner, simple booking design from Booking.com, chatbot support from Expedia, and personalized recommendations from Google Flights.
