EDUCATION

University of Central Florida | Orlando, Florida

Aug. 2026

B.S. in Computer Science

Relevant Courses: Discrete Structures, Systems Software, OOP, Matrix & Linear Algebra, Machine Learning

TECHNICAL SKILLS

Languages: Java, Python, C, Rust, Javascript, HTML / CSS, TypeScript, SQL, SQLite

Frameworks and Libraries: React, FastAPI, Express.js, scikit-learn, Pandas, NumPy, Matplotlib, Tauri

Developer Tools: VSCode, Jupyter Notebooks, Git, Eclipse, Postman, Filezilla, SwaggerHub

EXPERIENCE

SwapVest Capital | Tampa, Florida

Apr. 2025 - Present

Founding Software Developer / Co-Founder

- Built a full stack fintech prototype by developing a **React** frontend and **FastAPI** backend with **PostgreSQL**, demonstrating a secure, complete architecture for peer to peer stock exposure swaps.
- Implemented a **modular swap engine** by formalizing contract structures, collateral rules, and timeline logic, enabling **simulated trade matching and P&L calculations** across multiple scenarios.
- Designed **secure authentication and API infrastructure** by implementing **JWT-based** access control and role-protected endpoints, establishing a production-ready security foundation.

USASOC AI Division | Orlando, Florida

Feb. 2026 - Present

CARVER Software Backend Developer (SD Project)

- Developed an **offline-capable** backend analysis platform for a USASOC-sponsored senior design project using **Rust**, **Tauri**, and **SQLite**, enabling secure matrix-based analytical workflows on low-resource systems.
- Engineered secure authentication and session infrastructure by implementing **Argon2id** password hashing, backend validation, and role-based command handling, improving application security and local credential protection.
- Designed and normalized relational database schemas with **SQLite migrations** and foreign key constraints, streamlining data persistence for users, targets, and analytical matrices.

PROJECTS

NBA Game Supervised Learning Model | *Personal Project*

July 2024 - Mar. 2025

- Built a supervised **machine learning model** by training **scikit-learn** and **PyTorch** classifiers on historical NBA game data, **predicting game outcomes** based on team performance features.
- Engineered and preprocessed season-level features by aggregating win percentage, streaks, and home/away splits, **creating structured training and validation datasets** for model evaluation.

VibeCheck | *Large Team Project*

May 2025 - Aug. 2025

Role: Frontend / Full-Stack Engineer

- Developed interactive frontend components by using **React** with state management and lifecycle hooks, enabling **dynamic rendering** of location-based data on an interactive map.
- Integrated the **Google Maps and Places APIs** by handling autocomplete, geolocation selection, and marker rendering, allowing users to search, visualize, and interact with location-based activities.
- Connected the React frontend to backend endpoints via **JSON-based HTTP requests**.
